

My main goal for project 2 was to implement an App that consumes an API to compare it to my grad project specially the effort and time taken to implement such app. The app implementation went very well but with a lot of pain (I want to highlight that the app behavior looks much better on a physical device). With that being said, I can conclude now that ionic is the way to go if I'm going to develop a business app or an internal corporate app (which is the type of apps I'm interested in).

Regarding the app design, I'm not happy about it but my main focus was the app functionality. I'm sure that I will hire a professional designer if I'm going to publish apps to the stores. Finally, thank you for offering this course. I've learned a lot during this class and I'm looking forward for the advance one.
